

Patent	Why it is similar to our idea	Main difference
US10915884B2 – Processing mobile payments when disconnected from payment servers	Discloses an offline payment request, local approval message, and later sync to server; it explicitly mentions QR code in the claims Processing mobile payments when disconnected from payment servers+1.	It is merchant/payee-server oriented and does not describe your exact two-QR user-to-user request/confirmation design with local balance mirroring on both phones Processing mobile payments when disconnected from payment servers+1.
US20230196346A1 – Method and system of providing for offline blockchain transaction	Uses a device-to-device offline transfer flow with handshake, public key verification, signed transfer data, and later verification patents.google .	It is framed as blockchain transaction processing and does not clearly claim your receiver-generated request QR plus sender-generated signed confirmation QR sequence patents.google .
US11107066B1 / US20240104550A1 – Mobile wallet with offline payment	Covers mobile wallet offline payment using offline tokens, sequence checks, and cryptographic signing of offline token data Mobile wallet with offline payment+1.	It is token-centric, while your design is transaction-centric and uses QR-based mutual exchange plus later server reconciliation Mobile wallet with offline payment+1.
US20210065174A1 – Offline payment transaction in absence of network	Describes a user device and merchant device exchanging an electronic token with offline balance and digital certificate, including local verification and time validity Methods and Systems for Performing an Offline Payment Transaction in Absence of Network .	It focuses on an electronic token with certificate/decryption key rather than your signed transaction confirmation QR and pending-sync ledger update Methods and Systems for Performing an Offline Payment Transaction in Absence of Network .

US20150046337A1 – Offline virtual currency transaction	Very close at a high level: offline transfer, QR scanning, and payee confirmation are explicitly mentioned uspto .	It appears much broader and less aligned with your dual-QR, Ed25519 signature, timestamp expiry, and backend-reconciliation specifics uspto .
---	--	---

Draft differentiation points

To strengthen a patent filing, emphasize claims around:

- **Dual-QR handshake protocol** where one QR is a payment request and the second QR is a signed confirmation.[patents.google+1](#)
- **Local provisional ledger updates on both devices** immediately after scan/verify, before network settlement.Processing mobile payments when disconnected from payment servers+1
- **Canonical transaction string signing with Ed25519** and deterministic verification on the backend.[patents.google](#)
- **Expiry and replay controls** for both the request QR and confirmation QR.[Methods and Systems for Performing an Offline Payment Transaction in Absence of Network](#)
- **Server-side duplicate detection plus wallet-lock validation** during sync.
